

Overview:

- About GEANT4
- Where to get help
- Classes
- Detector construction
- Visualization/debugging
- Analysis

What is Geant4?

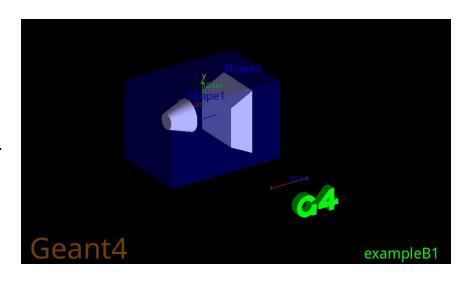

- Geant4 is a detector simulation toolkit for high-energy physics
- C++ Objective Oriented Programming
- We tell it what our experimental setup looks like, what particles we want to simulate and what physics we want to include
- Simulates millions of events up to us to work out what we want to measure/extract from this Monte Carlo simulation

Where to get help

- GEANT4 website tutorial: <u>http://geant4.web.cern.ch/collaboration/workshops/users2002/tutorial</u>
- List of examples (basic/extended/advanced)
- Google-fu
- I am happy to help with any issues

Working through an example

- Firing gamma rays/protons at bone/tissue inside water
- Special Geant4 variable prefixed with G4 (i.e. G4double)
- OOP C++ relies on a number of different classes which interact together to form our simulation – looking at example B1 (basic 1) – 6 MeV gamma
 - DetectorConstruction (defining our setup)
 - PrimaryGeneratorAction (particle source)
 - SteppingAction (finds the energy deposition in a selected volume for each particle step)
 - EventAction (event by event energy deposition)
 - RunAction (ties the simulation together and gets the event energy deposition)

Detector Construction

- Defining our setup done in terms of different volumes
 - Solid Volumes
 - Physical shape: G4Box, G4Sphere, G4Cons (segment of a cone), G4Tubs etc....
 - Can be combined, intersected, subtracted to make more complex shape from underlying polygons
 - Contains the geometric information about the shape
 - Logical Volumes
 - Tells us about the material, any EM fields it has and what solid volume (shape) it is made from
 - Can then place the logical volume and give location and orientation

Detector Construction

- First volume we need to define is the World volume
 - Simulations cannot be in absolute vacuum need to be in a world of at least very high vacuum. World volume can also just be air.
 - Make sure your world is big enough to fit everything in!!!

Define the size of our world:

env_sizeXY=20*cm

G4 types have units built in

G4Material – use built-in library to get properties of air

Define a physical volume – a box of *half-widths* x,y,z

Define a logical volume – our physical box defined above, made of our world material (air)

Place our logical volume, unrotated, at the origin, mother volume is 0 as we are defining the world (we are not placing the object into anything else)

```
G4cout<<env sizeXY/cm<<" cm"<<endl;
// World
G4double world sizeXY = 1.2*env sizeXY;
G4double world sizeZ = 1.2*env sizeZ;
G4Material* world mat = nist->FindOrBuildMaterial("G4 AIR");
G4Box* solidWorld =
                                            //its name
  new G4Box ("World",
    0.5*world sizeXY, 0.5*world sizeXY, 0.5*world sizeZ);
                                                                //its size
G4LogicalVolume* logicWorld =
  new G4LogicalVolume(solidWorld,
                                            //its solid
                      world mat,
                                            //its material
                      "World");
                                            //its name
G4VPhysicalVolume* physWorld =
                                            //no rotation
  new G4PVPlacement (0.
                    G4ThreeVector(),
                                            //at (0,0,0)
                    logicWorld,
                                            //its logical volume
                    "World",
                                            //its name
                                            //its mother volume
                    false,
                                            //no boolean operation
                                            //copy number
                    checkOverlaps);
                                            //overlaps checking
```

G4Materials

- A few ways to get materials
 - Can find material in database (CsI)
 - Can define via G4Element
 - Then can mix to make your own materials (e.g. Havar)

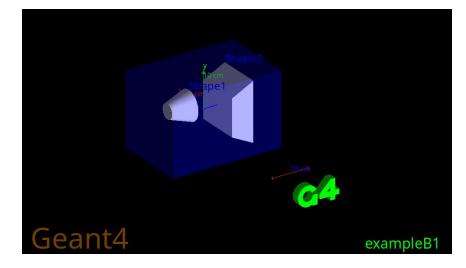

```
G4Material* si = G4Material::GetMaterial("G4 Si");
G4Material* al = new G4Material("al", 2.7*g/cm3, 1);
G4Material* be = new G4Material("be",1.848*g/cm3,1);
G4Element* Al = new G4Element("Aluminum", "Al", 13, 26.982*g/mole);
al->AddElement(Al,1);
G4Element* Be = new G4Element("Beryllium", "Be", 4, 9.012*g/mole);
be->AddElement(Be,1);
G4Material* CsI = G4Material::GetMaterial("G4 CESIUM IODIDE");
G4Element* Cr = new G4Element("Chrome", "Cr", 25,
                                                     51.996*q/mole);
G4Element* Fe = new G4Element("Iron" , "Fe", 26,
                                                    55.845*g/mole);
G4Element* Co = new G4Element("Cobalt", "Co", 27,
                                                     58.933*g/mole);
G4Element* Ni = new G4Element("Nickel", "Ni", 28,
                                                     58.693*g/mole);
G4Element* W = new G4Element("Tungsten", "W", 74,
                                                  183.850*g/mole);
G4Element* H = new G4Element("Hydrogen", "H", 1, 1.008*g/mole);
G4Element* C = new G4Element("Carbon", "C", 6, 12.011*g/mole);
G4Element* D = new G4Element("Deuterium", "D", 1, 2.014102*g/mole);
G4Element* Au = new G4Element("Gold", "Au", 79, 196.97*g/mole);
G4Material* Havar =
  new G4Material("Havar", 8.3*g/cm3, 5);
                                                      Number of
Havar->AddElement(Cr, 0.1785);
Havar->AddElement(Fe, 0.1822);
                                       Fractional
                                                      elements in
Havar->AddElement(Co, 0.4452);
                                       mass
                                                      G4Material
Havar->AddElement(Ni, 0.1310);
Havar->AddElement(W , 0.0631);
```

Detectors

```
// Envelope parameters
G4double env_sizeXY = 20*cm, env_sizeZ = 30*cm;
G4Material* env mat = nist->FindOrBuildMaterial("G4 WATER");
//
// Envelope
                            Embedded into logicWorld
G4Box* solidEnv =
 new G4Box ("Envelope", //its name 0.5*env_sizeXY, 0.5*env_sizeXY, //its size
G4LogicalVolume* logicEnv =
  new G4LogicalVolume (solidEnv,
                                           //its solid
                                           //its material
                      env mat.
                      "Envelope");
                                           //its name
new G4PVPlacement (0,
                                           //no rotation

                        false,
                                                         //no boolean operation
                                                         //copy number
                        checkOverlaps);
                                                         //overlaps checking
```

Primary Generator Action

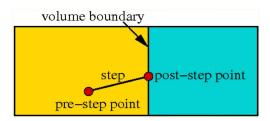

- Get a G4ParticleTable (list of lots of different particles that Geant4 already knows about), then find one called "gamma"
- Has proton, neutron, electron, alpha and heavier ions (mostly what we will be using)
- Our G4ParticleDefinition particle then has all the information we want about a gamma ray
- Our G4ParticleGun can then take this definition so we are loading 'gamma ray ammo' into the gun
- We define the direction we want to fire the gamma ray: along the z-axis
- We can set the energy to be 6 MeV
- Particle gun hasn't been fired yet

Generate Primaries

- Each time we fire, the generate primaries is called and what it does is find the envelope volume and randomly produce the gamma ray within 80% of the envelope
- We could also randomly change the direction/energy here if we desired – or make every nth random particle a neutron/geantino. Whatever we want.

```
G4double envSizeXY = 0;
G4double envSizeZ = 0;
if (!fEnvelopeBox)
  G4LogicalVolume* envLV
    = G4LogicalVolumeStore::GetInstance()->GetVolume("Envelope");
  if ( envLV ) fEnvelopeBox = dynamic cast<G4Box*>(envLV->GetSolid());
if (fEnvelopeBox) {
  envSizeXY = fEnvelopeBox->GetXHalfLength()*2.;
  envSizeZ = fEnvelopeBox->GetZHalfLength()*2.;
  G4ExceptionDescription msq;
  msq << "Envelope volume of box shape not found. \n";
  msg << "Perhaps you have changed geometry.\n";
  msg << "The gun will be place at the center.";
G4Exception("B1PrimaryGeneratorAction::GeneratePrimaries()",</pre>
   "MyCode0002", JustWarning, msg);
G4double size = 0.8;
G4double x0 = size * envSizeXY * (G4UniformRand()-0.5);
G4double y0 = size * envSizeXY * (G4UniformRand()-0.5);
G4double z0 = -0.5 * envSizeZ;
fParticleGun->SetParticlePosition(G4ThreeVector(x0, y0, z0));
fParticleGun->GeneratePrimaryVertex(anEvent);
```

Stepping Action

- Each time we have an interaction, we get a step
- When we have a boundary between volumes we will have a step
- Stepping Action therefore runs at each step:
 - Checks to see what volume our particle is currently in (current step)
 - Accumulates the energy deposited in this step for the scoring volume keeps track with an Event Action object

Event Action

- This is performed at the end of an event (i.e. primary generator has been created and all secondary particles have stopped or have exited our world)
- Accumulates all the energy deposited during the steps in the scoring volume
- Feeds into a Run Action object

```
{
    // accumulate statistics in run action
    fRunAction->AddEdep(fEdep);
}
```

Run Action

- Takes all of the Event Action energy deposits (event-by-event) and calculates a total dose that the phantom patient receives
- Prints dose after all of our gamma rays have been fired

```
G4int nofEvents = run->GetNumberOfEvent();
if (nofEvents == 0) return;
// Merge accumulables
G4AccumulableManager* accumulableManager = G4AccumulableManager::Instance()
accumulableManager->Merge();
// Compute dose = total energy deposit in a run and its variance
G4double edep = fEdep.GetValue();
G4double edep2 = fEdep2 GetValue();
G4double rms = edep2 - edep*edep/nofEvents;
if (rms > 0.) rms = std::sqrt(rms); else rms = 0.;
const B1DetectorConstruction* detectorConstruction
 = static cast<const B1DetectorConstruction*>
   (G4RunManager::GetRunManager()->GetUserDetectorConstruction());
G4double mass = detectorConstruction->GetScoringVolume()->GetMass();
G4double dose = edep/mass;
G4double rmsDose = rms/mass;
// Run conditions
// note: There is no primary generator action object for "master"
          run manager for multi-threaded mode.
const B1PrimaryGeneratorAction* generatorAction
 = static cast<const B1PrimaryGeneratorAction*>
   (G4RunManager::GetRunManager()->GetUserPrimaryGeneratorAction());
G4String runCondition;
if (generatorAction)
  const G4ParticleGun* particleGun = generatorAction->GetParticleGun();
  runCondition += particleGun->GetParticleDefinition()->GetParticleName();
  runCondition += " of ";
  G4double particleEnergy = particleGun->GetParticleEnergy();
runCondition += G4BestUnit(particleEnergy, "Energy");
// Print

   << G4endl
   << "----
   << G4endl
   << G4endl:
```

Running it all via 'main'

- We can run either in interactive mode or not (visualization options/can give macro commands in command line), multithreaded mode or not
 - Define randomness (important for MC)
 - Define runManager which takes everything together
 - Feed in our B1DetectorConstruction
 - Tell it what physics to include (many different physics lists that work well for different energy regimes and particles)
 - Feed in our ActionInitialization which just defines our EventAction, SteppingAction and RunAction
 - Can define visualization of our detectors and the particle tracks in 3D (not advisable over VPN)
 - Give the program a macro file

```
Detect interactive mode (if no arguments) and define UI session
G4UIExecutive* ui = 0;
if ( argc == 1 ) {
  ui = new G4UIExecutive(argc, argv);
// Choose the Random engine
G4Random::setTheEngine(new CLHEP::RanecuEngine);
// Construct the default run manager
G4MTRunManager* runManager = new G4MTRunManager;
G4RunManager* runManager = new G4RunManager;
  Set mandatory initialization classes
// Detector construction
runManager->SetUserInitialization(new B1DetectorConstruction());
G4VModularPhysicsList* physicsList = new QBBC;
physicsList->SetVerboseLevel(1);
runManager->SetUserInitialization(physicsList);
   User action initialization
runManager->SetUserInitialization(new B1ActionInitialization());
   Initialize visualization
G4VisManager* visManager = new G4VisExecutive;
// G4VisManager* visManager = new G4VisExecutive("Quiet");
visManager->Initialize();
// Get the pointer to the User Interface manager
G4UImanager* UImanager = G4UImanager::GetUIpointer();
// Process macro or start UI session
if ( ! ui ) {
  // batch mode
  G4String command = "/control/execute ";
  G4String fileName = argv[1];
  UImanager->ApplyCommand(command+fileName);
  // interactive mode
  UImanager->ApplyCommand("/control/execute init vis.mac");
  ui->SessionStart();
  delete ui;
// Free the store: user actions, physics list and detector description are
// owned and deleted by the run manager, so they should not be deleted
// in the main() program !
delete visManager;
```

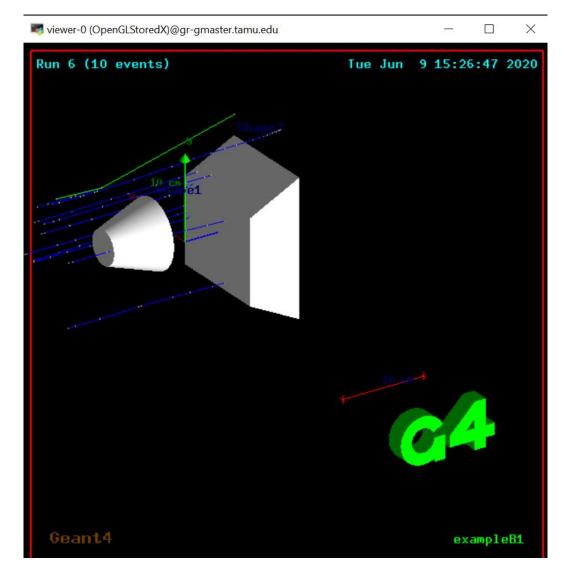

Macro files

- Macro files can:
- Launch the visualization window and set view angles, color options for different particles, hide different particles, wireframes, rotate in 3D and save to file to make gifs etc.
- Be used to set the particle gun parameters and fire
- Change verbosity for different parts of the program

```
Macro file for example B1
 Can be run in batch, without graphic
 or interactively: Idle> /control/execute run1.mac
 Change the default number of workers (in multi-threading mode)
#/run/numberOfWorkers 4
 Initialize kernel
run/initialize/
/control/verbose 2
/run/verbose 2
/event/verbose 0
/tracking/verbose 1
 gamma 6 MeV to the direction (0.,0.,1.)
/gun/particle gamma
gun/energy 6 MeV

Making the file on gr-gmaster

- Make a new folder (mkdir newfolder; cd newfolder)
- cp -r /home/grgroup/jackbishop/B1/.
- mkdir build
- cd build
- cmake .. (I prefer ccmake .. then use "c", "c", "g" to compile and generate)
- make
- We then get the exampleB1 file
- Run with ./exampleB1 and the visualization will slowly pop up
- In the command prompt, we can type /control/execute run1.mac and our macro will run
- Alternatively, we can avoid the visualization by ./exampleB1 run1.mac

Can you try changing:

- The particles fired (neutron/alpha/pion)?
- The energy
- The size of the 'body' components
- Make one of them out of something else
- Change the scoring volume

macro
